Re: BI Data Analyst, B.J.O.R.N.

Dear Hiring Team,

Your BI Data Analyst role asks for someone who tracks acquisition channels, keeps traffic, conversion and LTV dashboards honest, tests offers and affiliate traffic, and can tell a real drop from a broken number. That is close to my job right now. I'm a data scientist at ArenaPlus, DigiPlus's online betting brand in the Philippines, and most of my week goes into one question: which traffic sources and partners bring players who are worth what we pay for them?

What I'd bring, in five lines:

- Channel performance on value, not volume. I put CAC and 90-day value side by side for every traffic source. One agency cost **28x** more per paying player than our ad networks and had earned back **2%** of spend. I recommended cutting it and moving the money.
- Attribution that matches reality. We were paying a live-streaming partner on a per-player deal for **137x** more players than it actually sent. The company adopted my new rule: new players only, 7-day click window.
- LTV that holds up. My LTV model scores every player weekly. It is **58%** more accurate than our old rule, and its top 10% bring in **83%** of revenue. It also showed that **45%** of 90-day revenue arrives after the first month, so channels are no longer judged on a week of data.
- Tests people trust. I designed the A/B test every CRM campaign now runs on, with a stratified **10%** control group. Once offers were judged on real lift, promo spend fell from over 10% to about 5% of GGR within a month. That was about **PHP 10M** saved.
- Reports that catch problems early. I lead the weekly, monthly and quarterly marketing reviews for my department head, and built 10+ dashboards and KPI alerts for 5 teams, so a sudden drop or a broken number gets caught the same day.

I want to go deeper into monetization and performance marketing, and an iGaming affiliate business is where that work matters most. Every partner deal, landing page and offer is judged on the money it brings in, and the data decides what gets scaled and what gets cut. That is the kind of analysis I like doing.

How I'd start: learn the stack and the data, sit with the people who run the channels and partners, and find the one number the team trusts least today. That one gets fixed first.

The portfolio linked with my application shows the charts behind each number above. I would welcome the chance to walk you through them in an interview. And if it turns out to be a good fit, I would be glad to do this work with your team at B.J.O.R.N.

Best regards,
Donghwan (Kyle) Yun
