Donghwan (Kyle) Yun

BI Data Analyst | Acquisition channels, affiliate attribution, LTV
Manila, Philippines (remote) | yun090914@gmail.com | linkedin.com/in/donghwanyun
Page 3: cover letter | Pages 4-11: portfolio

SUMMARY

I've worked in analytics for 6+ years, the last three in iGaming (GGPoker, then ArenaPlus). Most of my week goes into one question: which traffic sources and partners bring players who are worth what we pay for them? I answer it by putting CAC and 90-day LTV on the same cohort, checking partner attribution against what really happened, keeping a control group on every campaign, and running LTV and churn models in production. The latest results: a partner credited for **137x** more players than it sent, now paid on a new rule, and about **PHP 10M** saved on promotions in a month. M.S., KAIST.

SKILLS

- Acquisition & affiliate analytics: CAC/CPA, early LTV (30 and 90-day value), ROI, payback, partner and affiliate attribution, conversion funnels, cohort analysis, budget allocation
- Experimentation & statistics: A/B testing (offers, campaigns), stratified control groups, difference-in-differences, anomaly alerts, backtesting
- Modeling: LTV and churn prediction, regression (linear, logistic), gradient boosting
- Data tools & languages: SQL, Python (pandas, scikit-learn), R, Snowflake, MaxCompute
- BI & dashboards: Tableau, Quick BI, Streamlit, Dash, Google Sheets, Lark Sheets
- CRM & automation: Optimove, Pipedream, Google Apps Script, Claude Code
- Languages: English (Fluent), Korean (Native), Mandarin (Basic)

EXPERIENCE

DigiPlus Interactive Corp. (ArenaPlus) Manila, Philippines
Data Scientist (Senior Specialist) & AP Part Leader Aug 2025 - Present

- Track CAC and 90-day value for every traffic source. One agency was costing us **28x** more per paying player than our ad networks, and had earned back **2%** of what we spent. I recommended cutting it and moving the budget to profitable channels.
- We were paying our live-streaming partner, LiveMatch, on a per-player deal for **137x** more players than it actually sent. I rewrote the attribution rule (new players only, 7-day click window) and the company adopted it.
- **45%** of a new player's 90-day revenue shows up after the first month. That cohort result stopped us from killing channels on one week of data.
- Built an LTV model that scores every player weekly. It is **58%** more accurate than the rule we used before, and the top 10% it picks bring in **83%** of revenue. Budget planning now starts from these scores.
- Designed and built the A/B test every CRM campaign now runs on: a stratified **10%** control group, with lift read at day 7 and day 30. Once campaigns were judged on real lift, promo spend dropped from over 10% of GGR to about 5% within a month. That is about **PHP 10M** saved, and betting volume held.
- Before an offer goes live, I replay it on past player data. One reward wheel would have cost **2.2x** its budget. We changed 8 of its conditions before launch.
- Built 10+ self-service dashboards and KPI alerts (Streamlit, Dash) for 5 teams, so a broken number or a sudden drop gets caught the same day. They save about **12 hours** of manual work weekly.
- Run the weekly, monthly and quarterly marketing reviews for my department head: what moved, why, and where to shift budget. The monthly one used to take 4-5 days to put together. Now it takes half a day.
- Built a VIP churn model (gradient boosting, backtested) that gives account managers a weekly call list. Casino VIP retention was up **8 percentage points** a month later.

NSUSLAB Korea (GGPoker) Seoul, South Korea

CRM Operator & Data Analyst, CRM Team Nov 2023 - Aug 2025

- Planned, ran and measured personalized CRM campaigns in Optimove: tournaments, new game launches, and dates like Valentine's Day. Revenue grew **25%** in 2024 and campaign ROI more than doubled.
- Some players only showed up for free rewards. Taking them out of the targets moved tournament campaign ROI from **2.3x to 3.5x** in a month.
- Win-back test: reminded inactive players of a big win they once had. It returned **3.1x** its cost.
- Automated the campaign report (3-4 days of work a month, now updated daily) and set alerts for any daily revenue swing over 10%.

Korea Automotive Technology Institute (KATECH) Cheonan, South Korea

Senior Researcher, Automotive Industry HR Development Committee Aug 2023 - Nov 2023

- Interviewed automakers, parts suppliers and training institutes, including focus groups, to find where the skills the EV industry needs and the training on offer don't match.

Korea Institute for Defense Analyses (KIDA) Seoul, South Korea

Researcher Sep 2020 - Aug 2023

- Built a text-mining model on North Korean state media that called provocations with **80%** accuracy. Also published an SSCI paper on Korea's Defense Innovation 4.0 plan.

TMAX BI Seoul, South Korea

Researcher (alternative military service) Feb 2018 - Sep 2020

- Planned and built screens and features for the company's B2B CRM platform, first Sales CRM and later HyperCRM.

Echo Marketing Seoul, South Korea

Account Executive & Data Analyst Jan 2015 - Sep 2015

- Naver stopped showing ad rankings, so I built a model to set search-ad bids without them. CPA fell **8%** in the trial.

EDUCATION

M.S. in Management Engineering, KAIST 2016 - 2018

GPA 3.94/4.3. Thesis: customer path analysis using sequential pattern mining.

B.S. in Industrial & Systems Engineering, KAIST 2011 - 2016

Dual degree in Business & Technology Management. GPA 3.54/4.3. Project: AI-based predictive modeling for semiconductor manufacturing.

Re: BI Data Analyst, B.J.O.R.N.

Dear Hiring Team,

Your BI Data Analyst role asks for someone who tracks acquisition channels, keeps traffic, conversion and LTV dashboards honest, tests offers and affiliate traffic, and can tell a real drop from a broken number. That is close to my job right now. I'm a data scientist at ArenaPlus, DigiPlus's online betting brand in the Philippines, and most of my week goes into one question: which traffic sources and partners bring players who are worth what we pay for them?

What I'd bring, in five lines:

- Channel performance on value, not volume. I put CAC and 90-day value side by side for every traffic source. One agency cost **28x** more per paying player than our ad networks and had earned back **2%** of spend. I recommended cutting it and moving the money.
- Attribution that matches reality. We were paying a live-streaming partner on a per-player deal for **137x** more players than it actually sent. The company adopted my new rule: new players only, 7-day click window.
- LTV that holds up. My LTV model scores every player weekly. It is **58%** more accurate than our old rule, and its top 10% bring in **83%** of revenue. It also showed that **45%** of 90-day revenue arrives after the first month, so channels are no longer judged on a week of data.
- Tests people trust. I designed the A/B test every CRM campaign now runs on, with a stratified **10%** control group. Once offers were judged on real lift, promo spend fell from over 10% to about 5% of GGR within a month. That was about **PHP 10M** saved.
- Reports that catch problems early. I lead the weekly, monthly and quarterly marketing reviews for my department head, and built 10+ dashboards and KPI alerts for 5 teams, so a sudden drop or a broken number gets caught the same day.

I want to go deeper into monetization and performance marketing, and an iGaming affiliate business is where that work matters most. Every partner deal, landing page and offer is judged on the money it brings in, and the data decides what gets scaled and what gets cut. That is the kind of analysis I like doing.

How I'd start: learn the stack and the data, sit with the people who run the channels and partners, and find the one number the team trusts least today. That one gets fixed first.

The portfolio linked with my application shows the charts behind each number above. I would welcome the chance to walk you through them in an interview. And if it turns out to be a good fit, I would be glad to do this work with your team at B.J.O.R.N.

Best regards,
Donghwan (Kyle) Yun

MARKETING ANALYTICS PORTFOLIO · 2026

Donghwan (Kyle) Yun

Data Scientist (Senior Specialist) · Marketing analytics

I figure out where marketing money actually pays off, and move it there.

yun090914@gmail.com Manila, Philippines · remote

HOW I WORK

1. **Check the number first**
   Rebuild it customer by customer.
2. **Compare fairly**
   Cost and revenue on the same customers.
3. **Test before trusting**
   A control group wherever the numbers allow.
4. **Prove it beats the old way**
   Or it doesn't go live.

PHP 10M
saved on promotions in one month

28x
an agency's cost per new customer vs ad networks

Partner payments
Paying only for real referrals

VIP retention
Who to call this week

CRM A/B TESTING · DIGIPLUS (ARENAPLUS) · 2026

I designed and built the A/B test every CRM campaign runs on

THE PROBLEM

Reports compared promo users with non-users, so every campaign looked like a win.

WHAT I DID

Designed a 10% control group, stratified so both groups start alike, and built it into every campaign send. Lift is measured at day 7 and day 30.

RESULT

Every campaign is now judged on its real lift. Within one month, from late 2025 into January 2026, promo spend fell from over 10% to about 5% of revenue, saving about PHP 10M.

PHP 10M saved on promotions in one month.

How the test works

Stratify
Group players by value and activity

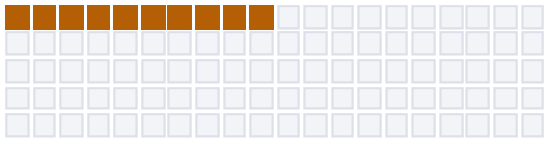

Split
Random 10% control in each group

Send
Only the other 90% get the campaign

Measure
Lift = campaign group minus control, day 7 and 30

Every send keeps 10 in 100 players as a control

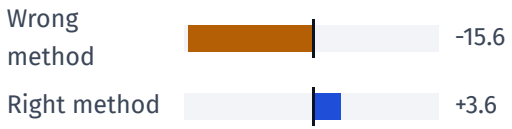

Stratified, so both groups start alike

Control (no campaign) · Gets the campaign

My first method made a working promotion look like a loss

Extra customers back within 7 days (percentage points)

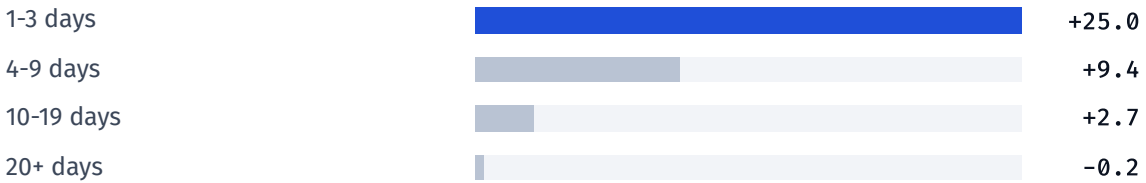

A simple comparison made one bonus look twice as good as it was

Return per peso spent on a slot bonus

Promotions bring back light players, not heavy ones

Extra return rate, by days played before the promotion (percentage points)

MARKETING CHANNELS · DIGIPLUS (ARENAPLUS) · 2026

One agency cost 28x more per customer. I proposed cutting it.

THE PROBLEM

Nobody had checked what our agency's customers cost against what they spent.

WHAT I DID

Compared every ad channel's cost per paying customer with their 3-month revenue.

RESULT

I recommended dropping the agency and moving the money to channels that make a profit.

28x what the agency cost per paying customer, compared with ad networks.

How I checked it

Match
177 promo codes matched to customers one by one

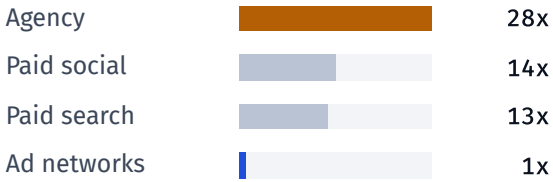

Value
3-month revenue per customer, after bonuses

Cost
Matched to the marketing team's cost sheet

Recommend
Drop the agency, move the money

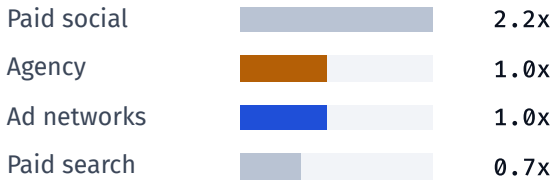

The agency cost 28 times more to get one paying customer

Cost per new paying customer (ad networks = 1)

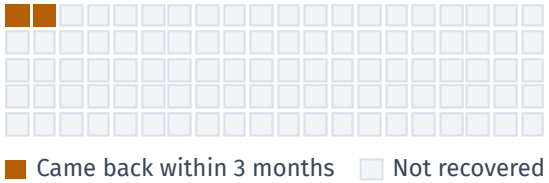

...but its customers spent about the same as ad-network customers

Revenue per customer in the first 3 months (ad networks = 1)

Only 2 of every 100 pesos spent on the agency came back

Revenue from its customers within 3 months

CUSTOMER VALUE · DIGIPLUS (ARENAPLUS) · 2026

A model that finds the customers worth spending on

THE PROBLEM

Budgets were planned on averages.

WHAT I DID

Built a model that predicts each customer's spend for the next year, tested on 12 past months.

RESULT

Its top 10% bring in 83% of revenue. Scores update every week and feed budget planning.

83% of revenue comes from the 10% of customers the model ranks highest.

How I built and tested it

Data
33 month-end snapshots of customer activity

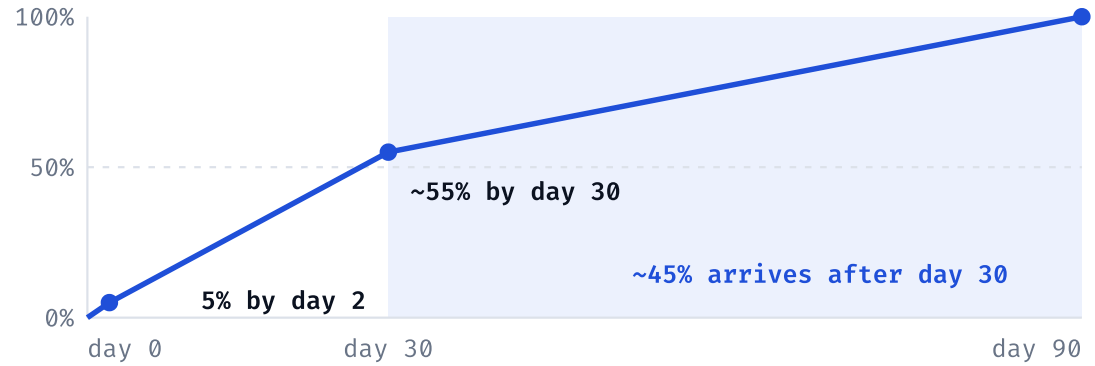

Train
Gradient boosting on the older months

Backtest
Checked on 12 newer months it never saw

Use
Weekly scores feed budget planning

Almost half of a new customer's 3-month revenue comes after the first month

Share of 90-day revenue, by day since joining

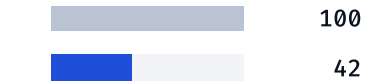

The model's top 10% bring in 83% of revenue

Share of total revenue from the top 10% each method picks

Its prediction error is less than half the old method's

Old method = 100, lower is better

BUDGET PLANNING · DIGIPLUS (ARENAPLUS) · 2026

Caught a 2.2x overspend before launch

THE PROBLEM

New promotion plans went live without anyone checking the real cost.

WHAT I DID

Ran each plan on past customer data before launch.

RESULT

A reward wheel would have cost 2.2 times its budget. We fixed it before it went live.

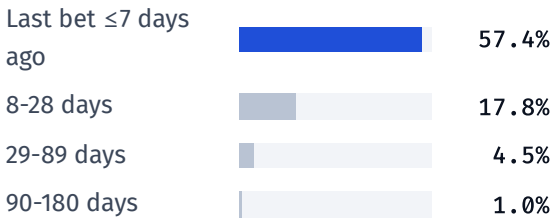

2.2x its budget, caught before launch.

How a plan is checked before launch

Over half of recent players come back with no promotion at all

Return within 7 days, by days since last bet

The reward wheel would have cost 2.2 times its budget

Black line = budget

Black line = the budget.

One promotion type took half the sports budget

PARTNER PAYMENTS · DIGIPLUS (ARENAPLUS) · 2026

We were paying a partner for 137x too many customers

THE PROBLEM

LiveMatch, our streaming partner, is paid for the customers it sends. Counts varied by up to 20x.

WHAT I DID

Checked the payments against each customer's history and priced four payment rules.

RESULT

We now pay only for customers who deposit within 7 days of a LiveMatch click.

137x more customers in the payment than LiveMatch actually sent.

How I checked the payments

Audit
Payment sheet vs customer records

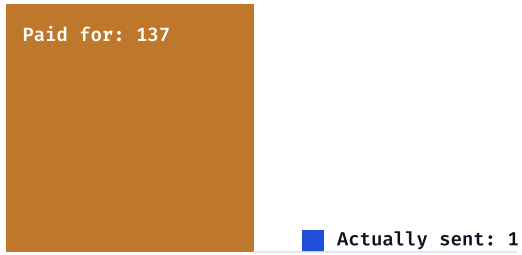

Compare
Four ways of counting referrals

Price
Four payment rules for the talks

Adopt
7-day click rule

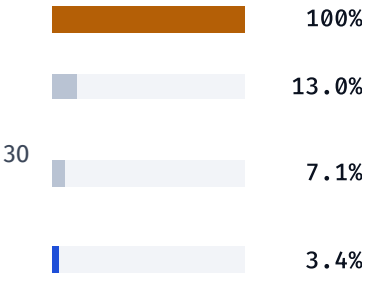

LiveMatch was paid for 137 customers for every 1 it sent

Area to scale

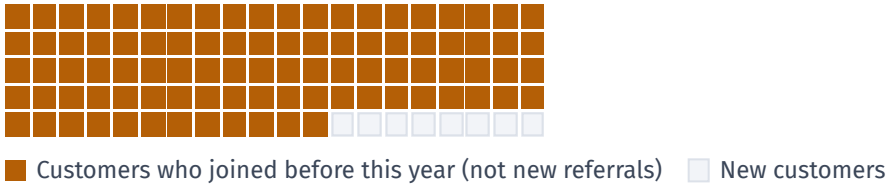

Each payment rule, as a share of the old contract

The company adopted the new-customer rule with a 7-day click window

92% of what the old contract paid on came from existing customers

Out of every 100 pesos of revenue it counted

VIP RETENTION · DIGIPLUS (ARENAPLUS) · 2026

Phone calls lifted casino VIP retention 8 points

THE PROBLEM

Account managers didn't know which VIPs to call.

WHAT I DID

Built a weekly at-risk list from a model plus the team's rule. Account managers called the VIPs on it.

RESULT

Casino VIP retention rose 8 points a month later. VIPs are too few for a control group, so I compared retention before and after. Sports barely moved, because the season matters more than a call.

+8pp casino VIP retention one month after the calls started.

How the test ran

Week 1
Model scores every VIP and ranks them A / B / C

Weeks 1–4
Account managers call the A list first

Month 1
Compare retention before and after

Result
Casino +8pp. Sports unclear

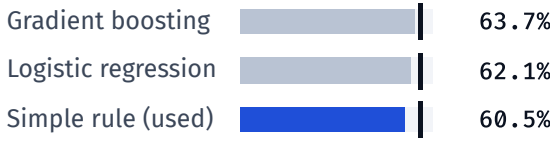

Casino VIP retention rose 8 points after the calls

Retention before vs one month after the calls. No control group: VIPs are too few

The model beat the old rule by only 3 points, so the rule stayed

Leaving VIPs caught in the top 10%. Line = the bar the model had to clear

BEFORE ARENAPLUS

Earlier work

GGPoker (NSUSLAB Korea) · 2023–2025

Personalized campaigns for a global poker site

Planned and ran personalized campaigns and measured every one. Revenue grew 25% and campaign return more than doubled.
