Donghwan (Kyle) Yun

Threat Investigator | Data-driven investigations, abuse and fraud detection
Manila, Philippines (APAC hours) | yun090914@gmail.com | linkedin.com/in/donghwanyun

SUMMARY

I've spent 6+ years turning large, messy data into findings people act on. For three years I was a researcher at the Korea Institute for Defense Analyses, where I built a text-mining model on North Korean state media that called provocations with **80%** accuracy. For the last three years I've worked in iGaming, finding abuse and over-crediting in player and partner data with SQL and Python, from sharp betting rings to bonus abuse, and writing up what to do about it. Korean native, fluent English, based in Manila. M.S., KAIST.

SKILLS

- Investigation & detection: SQL investigations on large player, transaction and partner data, anomaly detection and alerts, bonus abuse, sharp betting and referral over-crediting
- Programming & data: SQL (Snowflake, MaxCompute), Python (pandas, scikit-learn), R
- Machine learning & AI: text mining of news media, classification (gradient boosting, logistic regression), backtesting, using LLM coding agents (Claude Code) to scale analysis
- Reporting: written findings and recommendations for executives, weekly to quarterly reviews, dashboards (Tableau, Streamlit, Dash)
- Languages: Korean (Native), English (Fluent), Mandarin (Basic)

EXPERIENCE

DigiPlus Interactive Corp. (ArenaPlus) Manila, Philippines
Data Scientist (Senior Specialist) & AP Part Leader Aug 2025 - Present

- Investigated why a 24/7 basketball league (IPBL Pro) turned loss-making: a small group of specialist accounts, many newly created, was working live two-way markets and pushed customer win rates from 29% to 38%. **2.6%** of accounts drove **64%** of the July loss, and the top 50 took out **PHP 2.2M**. I flagged them to the risk team with limit and margin recommendations.
- Built the weekly Fraud & Risk data feed for the risk team: about **2.2M** transactions, **140K** promotion redemptions and per-player risk KPIs for **310K** players each week, delivered automatically to Lark.
- Built bonus-abuse signals into our player 360 view: players whose 90-day bonus exceeds 1.5x their GGR are flagged, and winning new players are split into consistent drainers, lucky winners and bonus abusers.
- Investigated a live-streaming partner's referral claims against our own sign-up and deposit records. It had been credited for **137x** more players than it actually sent. I wrote the new attribution rule (new players only, 7-day click window), and the company adopted it.
- Built 10+ KPI alerts, dashboards and data tools (SQL, Python, Streamlit, Dash) for 5 teams that flag sudden swings and broken numbers the same day. They save about **12 hours** of manual work weekly.
- Before a new reward wheel launched, I replayed it on past player data and found its conditions would let it cost **2.2x** its budget. We changed 8 conditions before launch.
- Built a VIP churn model (gradient boosting, backtested) that flags at-risk players for a weekly call list. Casino VIP retention was up **8 percentage points** a month later.
- Write the weekly, monthly and quarterly findings reviews for my department head: what moved, why, and what to change. As AP Part Leader I own these requests end to end.

NSUSLAB Korea (GGPoker) Seoul, South Korea
CRM Operator & Data Analyst, CRM Team Nov 2023 - Aug 2025

- Spotted bonus abuse in tournament campaigns: players who joined only to collect free rewards. Filtering them out of targeting moved tournament campaign ROI from **2.3x to 3.5x** in a month.
- Set alerts for any daily revenue swing over 10%, and automated a campaign report that took 3-4 days a month so it updates daily.
- Planned, ran and measured personalized CRM campaigns in Optimove for a global poker platform. Revenue grew **25%** in 2024.

Korea Automotive Technology Institute (KATECH) Cheonan, South Korea

Senior Researcher, Automotive Industry HR Development Committee Aug 2023 - Nov 2023

- Interviewed automakers, parts suppliers and training institutes, including focus groups, to find where the skills the EV industry needs and the training on offer don't match.

Korea Institute for Defense Analyses (KIDA) Seoul, South Korea

Researcher, Defense Research (Predictive Analytics) Sep 2020 - Aug 2023

- Built predictive models of military provocation risk from North Korean state media, combining text mining with statistical and machine learning methods. The model called provocations with **80%** accuracy.
- Tracked patterns and early risk indicators in the data, and turned them into findings for national security research.
- Applied quantitative modeling to defense and security problems, and published an SSCI journal paper on Korea's Defense Innovation 4.0 plan.

TMAX BI Seoul, South Korea

Researcher (alternative military service) Feb 2018 - Sep 2020

- Planned and built screens and features for the company's B2B CRM platform, first Sales CRM and later HyperCRM.

Echo Marketing Seoul, South Korea

Account Executive & Data Analyst Jan 2015 - Sep 2015

- Naver stopped showing ad rankings, so I built a model to set search-ad bids without them. CPA fell **8%** in the trial.

EDUCATION

M.S. in Management Engineering, KAIST 2016 - 2018

GPA 3.94/4.3. Thesis: customer path analysis using sequential pattern mining.

B.S. in Industrial & Systems Engineering, KAIST 2011 - 2016

Dual degree in Business & Technology Management. GPA 3.54/4.3. Project: AI-based predictive modeling for semiconductor manufacturing.

Re: Threat Investigator - APAC, 10a Labs

Dear 10a Labs team,

Your Threat Investigator role asks for someone who finds bad actors in large internal datasets with SQL and Python and writes findings that lead to action. That is the core of what I have done for six years, first in national security research and then in online gaming.

What I'd bring, in five lines:

- Intelligence background. For three years I was a researcher at the Korea Institute for Defense Analyses, where I built a text-mining model on North Korean state media that called provocations with **80%** accuracy, and published an SSCI paper.
- Investigations in platform data. At ArenaPlus I traced a league's sudden losses to a small group of specialist accounts working live markets: **2.6%** of accounts drove **64%** of the loss, and I flagged them to the risk team. I also found a partner credited for **137x** more players than it actually sent.
- Abuse patterns. I built bonus-abuse signals into our player 360 view, and at GGPoker filtering bonus abusers out of tournament campaigns moved ROI from **2.3x to 3.5x**.
- Detection that runs every day. I built the weekly Fraud & Risk data feed for our risk team (about **2.2M** transactions a week) and 10+ alerts that flag sudden swings the same day. I use LLM coding agents to scale my own analysis.
- APAC fit. I am a native Korean speaker with fluent English, based in Manila, and comfortable with Sydney hours and an on-call rotation.

I'm drawn to this work because it applies the same skill, finding the pattern a bad actor leaves in the data, to problems that matter far beyond revenue. I understand the role involves disturbing material, including child safety cases, and I am prepared for that.

How I'd start: learn the platform's data and the team's playbooks, shadow live escalations, and turn the first patterns I investigate into repeatable queries the team can reuse.

I would welcome the chance to walk you through my work in an interview. And if it turns out to be a good fit, I would be glad to join the APAC Investigations Team.

Best regards,
Donghwan (Kyle) Yun
